

Imaging and Theranostics in early phase trials

A/Prof Louise Emmett
Garvan Institute of Medical Research
St Vincent's Hospital Sydney

OLD TECHNOLOGY

BONE scan

NEW TECHNOLOGY

PSMA PET CT scan

Imaging biomarkers

- Predictors of response (important for eligibility for treatment)
- Ligands for delivering therapeutic payload
- Quantify dose delivered to tumour cell.
- Measure treatment response
- Determine best next treatment options

PERFECT TARGET- PSMA

Cell surface enzyme –folate hydrolase

750-amino acid type II transmembrane glycoprotein expressed in normal human prostate epithelium.

Over-expressed (1000 x) in **virtually** all prostate cancers (95%). Expression increased in poorly differentiated, metastatic and castration-resistant carcinomas.

Rapid cellular internalisation via clarithromycin coated pits following ligand-receptor binding.

THERANOSTICS

THERAPY

Lu ¹⁷⁷ DKFZ – 617 PSMA

Small molecule peptides and
Radionuclides used for both
Therapy and diagnosis
'Theranostics'

DIAGNOSIS

Ga⁶⁸ PSMA -11

Immuno-electron microscopy revealing endocytosis of PSMA binding antibody in prostate cancer cells

Antibody location
revealed using gold
bead labelled goat
anti-mouse antibody

Liu et al. *Cancer Res* 1998;
58(18): 4055-60.

PSMA as imaging biomarker

- Highly specific for prostate cancer
- Volume of active disease on PSMA reflective of disease burden in most patients
- Not all prostate cancers express PSMA
- Significant heterogeneity in end stage patients

Lutetium 177

- Radioactive element
- $T^{1/2}$ 6.7 days
- 90% decay as Beta emission
- 10% Gamma and X-ray.
- Outpatient treatment possible with careful management of radiation safety.
- Rapid renal excretion
- Good physical characteristics for radionuclide therapy
- Able to chemically label to PSMA (stable)

Prospective Observational Trial of Lu¹⁷⁷ PSMA in men with symptomatic progressive mCRPC: Toxicity, safety, dosimetry and biochemical response.

Louise Emmett, Anthony Joshua, Richard Epstein, Bao Ho, Quoc Nguyen, Robert Kent, Jane Shin, Jenny Hvalica, Ashley Blanksby, Lalith Ratnayake, Lisa Horvath, Phillip Stricker.

Partner trial with Peter Macallum Cancer Institute

Lu PSMA – St Vincent's

- Prospectively accrued trial in men with mCRPC (n=15).
- Must have failed ADT, Androgen blockade therapy and either failed, refused or not eligible for Chemotherapy
- Rising PSA and imaging failure.
- Symptomatic disease.
- Study Aims
 - Assess biochemical response to therapy and measure treatment response with both RECIST and PERCIST measures
 - Assess safety and toxicity profile
 - QOL and pain assessments

Enrolment

- Must meet clinical criteria (mCRPC) and symptomatic rising PSA
- eGFR >40mls/min, HB>90, platelets >70.
- Must have imaging compatible with likely response
 - Ga PSMA and F18 FDG PET CT as screening
 - Require disease > 90% PSMA avid and intensity 2 x liver on PSMA PET CT imaging.

Screening

- 20 men screened for trial with GaPSMA PET CT and F18 FDG
- 14/20 Eligible on trial criteria and enrolled.
- 6/20 Ineligible
 - 2/20 insignificant PSMA expression
 - 4/20 PSA stable (1/20)/ marrow failure prior to injection of Lu PSMA (3/20).

Screen Failures

F18FDG

Ga PSMA

- 5-10% Prostate cancers do not express PSMA
- PSMA -/FDG +
- 2/20 Screens in mCRPC cohort

SCREEN SUCCESS

GaPSMA

Median SUV max 40

F18 FDG

Therapy Schedule

- Lu PSMA dose determined on GFR, number of sites and patient weight – 6.5-8.0Gbq.
- 4 doses of Lu PSMA at 6 weekly intervals
- 2nd weekly bloods
 - PSA
 - Hb, platelets, wcc, UEC, LFT.

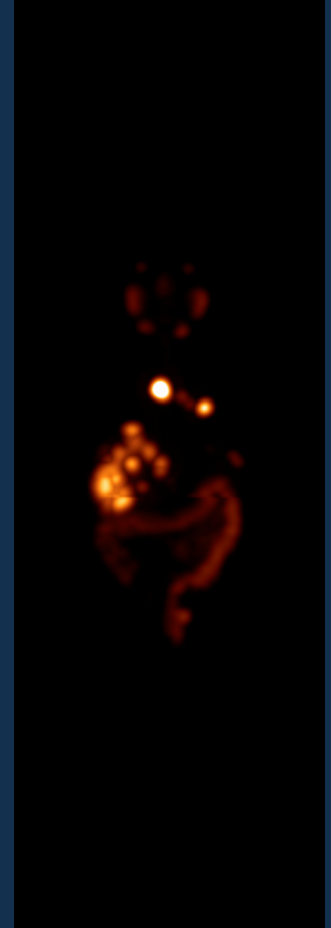

LU PSMA Scan Dose 1

- 75 yo mCRPC
- Visceral and LN mets
- RTX hilar mets 2015
- Failed ENZA/ DOCE/ CAB
- PSA 340 ng/ml
- PSA 15 ng/ml post dose 2

Ga PSMA POST TREATMENT

Ga PSMA PRE- TREATMENT

921.203

4921.203

PSA Response

Any PSA response 10/14 patients 71% (mean 59% reduction in PSA)
> 50% reduction in 5/14 (36%) (4/5 >70% reduction)
> 30% reduction in 9/14 (64%)

PSA Response

Non Responders: 3/4 men borderline / markedly heterogenous PSMA expression on screening images.

No PSA response to therapy

Lu PSMA SPECT CT

Dose 1

Dose 2

Inadequate PSMA intensity

Post Tx FDG
diffuse marrow
activity

Marrow trephine:
Poorly Diff adeno
ca.

Patterns of Response

	FINDING	SIGNIFICANCE FOR MANAGEMENT
Pattern 1	Progression with diffuse, widespread low PSMA avid disease (SUV max 2-7 all sites)	Progressive non PSMA avid phenotype. change tx
Pattern 2	Marked tx response at all initial sites. Solitary PSMA -/FDG+ lesion	Treat solitary site of PSMA – disease with focal tx. Continue treating PSMA avid sites with Lu PSMA
Pattern 3	Marked reduction in PSMA + sites, but persistent PSMA activity (SUV max >10) + new PSMA avid lesions	Disease amenable to tx with LuPSMA. Consider continuing beyond 4 doses of Lu PSMA.
Pattern 4	Marked reduction in PSMA /FDG at all sites (>75%). Low volume residual activity only	Cease tx with Lu PSMA until PSA rise / repeat PSMA shows progression, then retreat with Lu PSMA.

Response Type 1

Treatment Response 1

- 75 yo male CRPC
- Failed ADT, ENZA, DOCE, CABAZITAXEL
- Lu PSMA 2 doses
- PSA 1580 → 1520ng/ml → 1680ng/ml

Pre treatment Ga PSMA

Post treatment Ga PSMA

Significant partial metabolic response to therapy
at all nodal sites.

2 new sites of metastatic bone disease – still PSMA avid

Decision: Continue with Lu PSMA therapy?

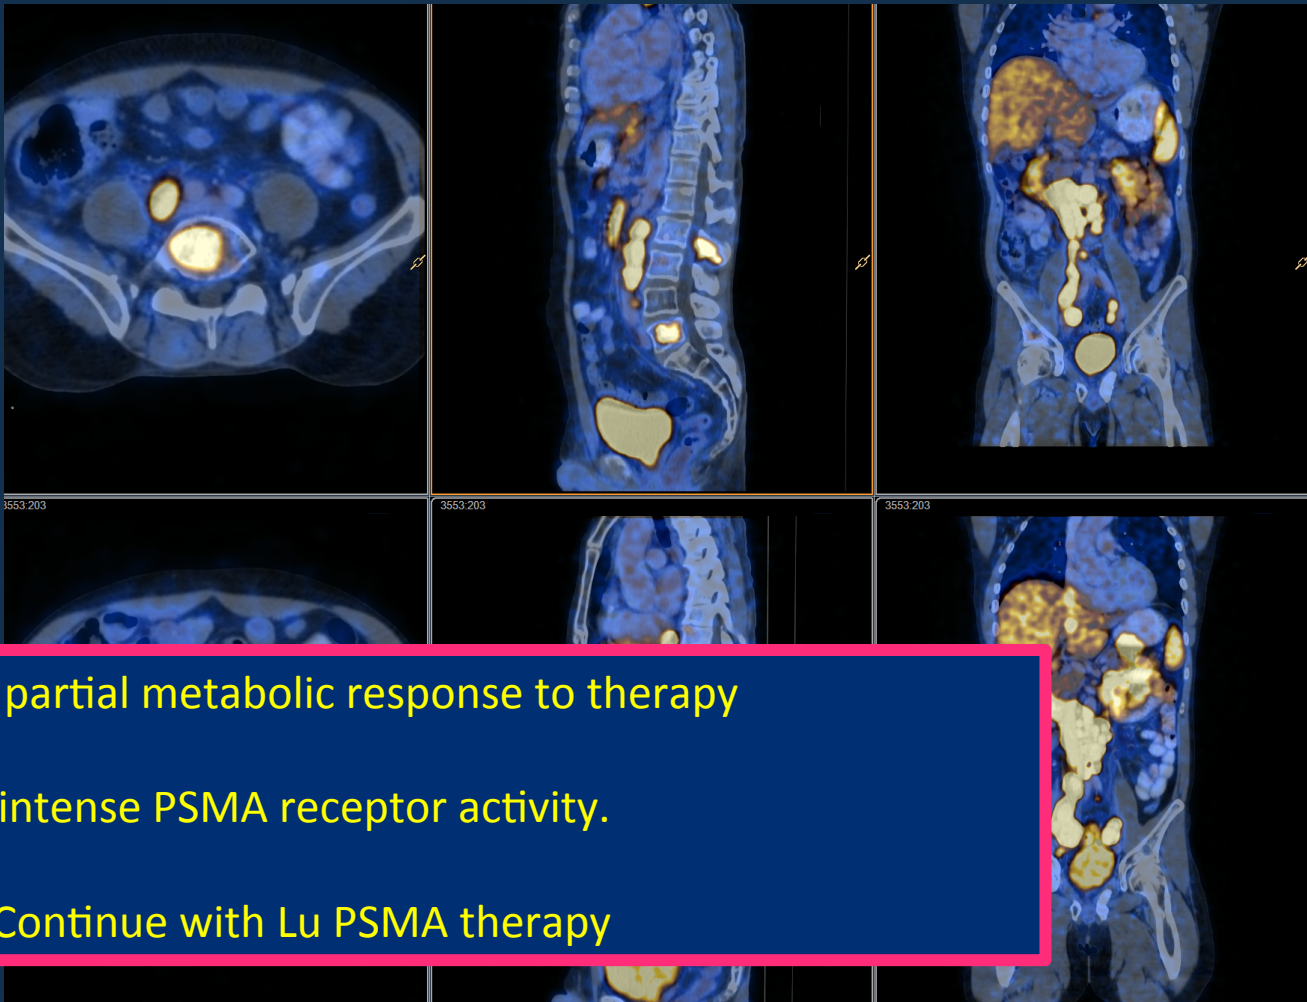

- 58 y.o
- mCRPC failed ADT, Abi, Docetaxel , Cabazitaxel
- PSA 11 → 5.6 → 9.0ng/ml
- ? Continue dose 4

Post treatment Ga PSMA

Pre treatment Ga PSMA

Significant partial metabolic response to therapy
at all sites.

Persistent intense PSMA receptor activity.

Decision: Continue with Lu PSMA therapy

Treatment Response

SUV max 15-

PSMA PET CT response imaging may allow:

- Delineation of pattern of failure
- Identifying selected genetic subtypes.
- Gives direction to next best treatment options
